

A better MDM

Legacy MDMs have left you in the dark for way too long. Fleet's cross-platform MDM gives IT teams more visibility out of the box.

Device management with telemetry

Fleet delivers real-time answers to every team and tool

All platforms welcome

Give your teams access to any machine regardless of OS or manufacturer. Fleet MDM supports Mac, Windows, and Linux devices. So, you can make the most of your resources (and make everybody's lives easier).

Real-time visibility

Don't worry about your workstation configuration being out of date. Fleet makes it easy to see which settings have been applied to your devices. Real-time results reveal the status of your entire fleet at any given moment. Launch custom workflows around those results with scheduled queries.

Built for customization

Instead of forcing you to use a static MDM, we went for a more collaborative approach. Deliver data where it benefits your engineering and IT teams the most with GitOps compatibility and a ton of integrations. Our API and CLI provide the flexibility to program Fleet as you see fit.

Fleet MDM roadmap

The path to a better MDM starts here

- Report on disk encryption status
- User-initiated device enrollment
- Remotely enforce OS settings
- Zero-touch device setup
- Remotely update OS version
- Low-level MDM commands
- Keep OS up to date through reminders
- Encrypt computer hard disks
- Manage queued MDM commands
- Remotely lock and wipe computers
- Trigger a workflow based on a failing policy
- Update apps on computers

Don't know osquery?

Dedicated support from osquery experts

Osquery is the open-source agent that powers Fleet. And we have the most osquery experts around. We'll help you realize the potential of this tool for your organization.

Uber

Exciting. This is a team that listens to feedback.

Erik Gomez
Staff Software Engineer @Uber

Square

Mad props to how easy making a deploy pkg of Orbit was. I wish everyone made stuff that easy.
